**KlompTek Announces Launch of Track and Protect (TnP) Beta-test Program
for BlackBerry Devices**

***Beta testers will be able to evaluate the entire range of TnP features,
including remote tracking, camera control and call-back features***

Zaandam, The Netherlands – October 21, 2010 – [KlompTek](http://www.klompTek.com), an innovative software development company specializing in mobile device management and security solutions, announces the launch of a public beta program for its [Track and Protect](http://www.klompTek.com) (TnP) client-server web security service for BlackBerry devices. Participants will be able to engage and test the full range of security features of the TnP remote management tool to monitor, lock and wipe data in the event that their BlackBerry is lost or stolen.

BlackBerry users are invited to send an email to trackandprotect@klompTek.com, listing their device's model number, their mobile phone number and country of residence to receive a download link. Prospective participants may also visit KlompTek's [TnP Facebook page](http://www.facebook.com/pages/Track-and-Protect/168119466533491) (<http://www.facebook.com/pages/Track-and-Protect/168119466533491>) for details. TnP is currently commercially available for Android and Symbian devices.

TnP is a remote management tool and security application that allows users to monitor, lock and wipe data from a lost or stolen cell phone. In addition to being able to secure content on the device through remote commands sent via the TnP web service, users are able to track the location of the missing phone in real time through the TnP online mapping system and take photographs from the device of its present surroundings, with the ability to listen in and capture images of the phone's current possessor. TnP allows users to collect enough information -- including current location, new phone number, operator ID and facial photographs -- to generate a substantive police report. All features are operable even after illegal SIM change.
