**KlompTek Releases Track and Protect (TnP) Mobile Device Security Service  
for BlackBerry**

***The third supported platform for TnP, users can now monitor, track and secure  
lost or stolen BlackBerry devices from a remote location***

**Zaandam, The Netherlands – November 23, 2010** – [KlompTek](http://klompTek.com), an innovative software development company specializing in mobile device management and security solutions, is pleased to announce that its [Track and Protect](#) (TnP) security application is now available for BlackBerry smartphones. TnP for BlackBerry joins previously released versions for Symbian and Android in an increasing lineup of platforms supported by the application that allows users to monitor, lock and wipe data from their lost or stolen cell phones.

TnP is a remote management tool and security application that can be used to secure content on a mobile device through remote commands sent via the TnP web service. Users are also able to track the location of the missing phone in real time through the TnP online mapping system, with the ability to listen in and capture images of the phone's current possessor. All features are operable even after illegal SIM change. TnP is unique in its approach of protecting users' property in that it allows the collection of enough information -- including current location, new phone number, operator ID and audio of the phone's surroundings -- to generate a substantive and actionable police report.

KlompTek launched a public beta program on October 21, 2010, allowing BlackBerry users to test features of the TnP application on their devices in real-world scenarios. Feedback gathered from the beta test was extremely positive, including that of one user

**-MORE-**

who successfully retrieved a lost BlackBerry by snapping photos of the device's current location through the TnP website. Despite having no GPS coverage and inaccurate mapping information, the owner managed to track the device to a metro train floor, the location of which had been confirmed by train sounds heard through the application's remote audio feature.

TnP for BlackBerry uses a standard SMS listener to efficiently protect the device with very low battery drain. Coverage is global, allowing users to protect and recover their BlackBerry devices anywhere in the world. Further, the application's proprietary SMS-command encryption algorithms safeguard data transfers, making TnP impenetrable to passcode theft. TnP has recently [been voted](#) the most innovative product by a peer jury and members of the Telecom Society (TSOC).

TnP is available for BlackBerry OS version 5.x or 6.x. Users running 4.x are invited to upgrade their OS through BlackBerry Desktop Software prior to downloading the TnP application. Download TnP for BlackBerry at [http://www.trackandprotect.com/TnpClient\\_BB.jad](http://www.trackandprotect.com/TnpClient_BB.jad), or by searching 'Track and Protect' in the BlackBerry App World.
